About Cognilytica

• Training, Certification, and Research on emerging tech best practices focused on *artificial intelligence, machine learning, automation, big data,* and *advanced analytics.*

• Developed the Cognitive Project Management for AI (CPMAI) certification, with thousands certified since 2017

• Thousands of clients in public and private sector

• Kathleen Walch and Ron Schmelzer are *Managing Partners* of Cognilytica

80%+ of AI Projects Fail

- According to TechRepublic, 85% of AI projects eventually fail to bring their intended results to the business.
- According to Gartner, 85% of Machine Learning (ML) projects fail.
- According to IDC, most organization polled reported failures among their AI projects, with a quarter of them reporting up to a 50% failure rate.
- According to a report from the Project Management Institute, only about 70% of all projects completed in 2017 met original goals and business intent.

*It’s not bad technology or bad people that’s the problem*

*It’s the lack of following best practices*

Lesson Learned from Failed AI Projects

AI projects are NOT like traditional software development projects
AI is Not About Application Development

*AI is not about application development!*

**It’s about data**

- The code is a small part of making AI work. *And not even the most important part*

*If you run your AI Projects like you run your Application Development Projects you’re going to find out the hard way that it won’t work.*

CPMAI Phase I: Business Understanding

**Answer the fundamental questions and perform tasks:**

- What problem are we attempting to solve?
- Should we solve this problem with AI / Cognitive Technology?
- What portions of the project require / do not require AI?
- What AI patterns are we implementing?
- What are the criteria for project success?
- What requirements are needed to complete the project?
- What other important considerations are there for the AI project?
- What skills are necessary for successful project completion?

Data Quantity Issues (and a lack of data understanding)
Amazon scraps a secret A.I. recruiting tool that showed bias against women

PUBLISHED WED, OCT 10 2018-6:15 AM EDT | UPDATED THU, OCT 11 2018-2:25 PM EDT

KEY POINTS

• Amazon.com's machine-learning specialists uncovered a big problem: their new recruiting engine did not like women.

• The team had been building computer programs since 2014 to review job applicants' resumes with the aim of mechanizing the search for top talent, five people familiar with the effort told Reuters.

• The company's experimental hiring tool used artificial intelligence to give job candidates scores ranging from one to five stars — much like shoppers rate products on Amazon, some of the people said.
CPMAI Phase II: Data Understanding

Answer the fundamental questions and perform tasks:

- What data are necessary to achieve the objectives?
- What is the quantity and quality of our data?
- What internal and external data is necessary?
- What requirements to augment existing data?
- What are the requirements for ongoing data gathering and preparation?
- What are the requirements for technology for data manipulation and transformation?
- What other important data-relevant considerations are there for the AI project?

CPMAI Phase III: Data Preparation

Answer the fundamental questions and perform tasks:

- How must data be transformed to meet requirements?
- Implementation of data cleansing, transformation, and manipulation
- Iterations of the data engineering pipeline
- Means by which data quality can continuously be monitored and evaluated
- Use, extension, and modification of third-party data
- Human-involved data annotation and manipulation (“labeling”)
- Performance of additional data augmentation steps

CPMAI Phase IV: Model Development

Answer the fundamental questions and perform tasks:

- How can the data be transformed into a machine learning model that meets the project requirements?
- Performance of model training activities
- Performance of model optimization activities
- Determination of appropriate algorithms, settings, and hyperparameters
- Creation of ensemble models
- Use of third-party models or extensions of models
- Model development as appropriate for selected machine learning technique
Lesson Learned from Failed AI Projects

The Real World Doesn’t Match your Model.
“It turns out," Ng said, “that when we collect data from Stanford Hospital, then we train and test on data from the same hospital, indeed, we can publish papers showing [the algorithms] are comparable to human radiologists in spotting certain conditions."

But, he said, “It turns out [that when] you take that same model, that same AI system, to an older hospital down the street, with an older machine, and the technician uses a slightly different imaging protocol, that data drifts to cause the performance of AI system to degrade significantly. In contrast, any human radiologist can walk down the street to the older hospital and do just fine."
CPMAI Phase V: Model Evaluation

**Answer the fundamental questions and perform tasks:**

- Does the model meet requirements for accuracy, precision, and other metrics?
- Determining and evaluating concerns on overfit and underfit of models
- Evaluation of training, validation, and test curves for overall acceptability
- Evaluation of models against business Key Performance Indicators (KPIs)
- Determination of model suitability with regards to operationalization approach
- Determination of means for model monitoring
- Determination of means for model iteration and versioning

CPMAI Phase VI: Model Operationalization

Answer the fundamental questions and perform tasks:

- How will this model be used in production / operational environments?
- What are the requirements for data flow for model to be useful?
- What are the requirements for performance?
- Operationalization of model in different environments
- Implementation of model monitoring
- Implementation of model versioning and governance

Number One Lesson Learned from Why AI Projects Fail

Overpromising and Underdelivering

- Do you even know what problem you’re trying to solve?
- Why are you tackling the hardest possible problem first?
- Why are you trying to tackle many AI Patterns at the same time?

Think Big. Start Small. ITERATE OFTEN.

This is the recipe for success.
